Introduction-Business Problem

Introduction :

There are many investors which investigate in restaurants but their investment does not succeed, that is not by chance, because of the place chosen, the behaviors of people in this place, the type of product that they buy do not pay attention of client,

Problem Description:

Now, I have an investor who wants to open a restaurant in Canada, Toronto, his first problem is that he doesn't know a better place, and he is looking for a safety place, and his second problem is which type of dish that they can make to pay attention of all categories of people,

Target Audience:

To solve these problems, as a data scientist my objective is to locate a safety place in Toronto, and search in this place for what are the preferable dishes for people in this place, by looking at the restaurants in this place what type of dish they buy.
